\* Variable costs PU = €8.50 + €14.00 + €3.50 + €2.66 = €28.66

#### (v)

#### Step fixed costs

Step fixed costs are costs that are fixed within a certain range of activity but change outside of that range. **[2]** 

E.g. rent could be fixed up to a certain level of production. However, if production increases and results in the rental of more factory space, then the rent would increase to a new level. Thus, the fixed costs would increase in steps. **[2]**

#### (ii) Marginal v Absorption Costing

There is a different profit figure because closing stock is valued differently.

Marginal costing does not include fixed costs when costing a product whereas absorption costing does include the fixed costs.

Therefore, closing stock under marginal costing is valued lower than under absorption costing because a share of fixed costs is included in the value of stock under absorption costing but not included under marginal costing.

Under absorption costing, closing stock is valued at 20% of the production cost of €36,150.

Under marginal costing, closing stock is valued at 20% of the production cost of €27,750.

Closing stock under absorption costing is €7,230. Closing stock under marginal costing is €5,550.

This is a difference of €1,680.

The profit difference is €21,480 – €19,800 = €1,680

Absorption costing should be used as it agrees with standard accounting practice and concepts and matches costs with revenues.
